Project 5

In your project 4 you had to validate the user's entry to make sure that the user will always enter the correct value/type. For this project you must **use exception to handle all types of errors** while keeping the program to run as long as the user does not choose the exit option from the menu.

Method withdraw in project4 will allow the user to overdraft a maximum of \$1000.00, **use exception** to prevent withdrawing more than this amount.

Use appropriate output statements when invoking different methods or when handling an error, so the user can understand your code (make your code user VERY friendly)
